Breakwater Market
Prototype budget and scope note

Prepared November 6, 2026. Currency: USD. This budget describes the prototype candidate and possible later work. Any development award, milestone contract, revenue share or future spending would require a separate agreement.

Recorded project purchases

Game runtime and build dependency purchases: $0. The game uses HTML, CSS and JavaScript with embedded styles and scripts.

Art, music and licensed asset purchases: $0. The interface uses original CSS shapes, and the game is silent.

Game-runtime API and hosting purchases: $0. The game runs locally. Current testing uses existing local equipment.

Additional equipment or software purchases: $0. Existing equipment and available software entitlements were used. Those resources have their own historical costs.

Total recorded project purchases: $0. Existing development-tool and model usage, compute, and hardware costs are unallocated here.

Developer and review time remains unbilled. Human playtesting is future work.

Possible next work

The following are planning estimates only. Participation arrangements, external review costs and any funding request would be settled in a separate agreement.

- Human playtesting and onboarding review: arrange a small consent-based session, record task completion and points of confusion, and revise the instructions from those observations. Estimated implementation/analysis effort: 8 to 16 hours. Recruitment method, participation and compensation remain to be arranged.
- Accessibility review with assistive-technology users: test screen-reader announcements, focus order and narrow layouts. Estimated preparation/fix effort: 6 to 12 hours. Specialist participation and compensation would need separate agreement.
- One additional scenario structure: prototype and independently check a new publicly disclosed incident pattern, then test whether it creates a comprehensible decision. Estimated development effort: 8 to 16 hours, using the existing game tools.
- Language adaptation: obtain fluent review of translated game text and financial examples before adding a language. Scope, hours and price depend on the reviewer and language.

Delivery scope

The reviewable deliverables are a downloadable standalone HTML build, readable source,

reproducible tests and evidence, screenshots, a design-document PDF and this budget PDF. Publication and entry status are tracked separately from these local deliverables.
